1. Claims 4-21 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims 4-21 not been further treated on the merits.

***Claim Rejections - 35 USC § 102***

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-3 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by Markart (USP 6,441,898).

Markart teaches an analytical test element(18) for the measurement of blood glucose. Column 5 lines 3+ describe the construction of the test strip in figures 2-4. The strip(18) comprises carrier web(26) that is covered with reagent/paint layer(34) and diaphragm strips(30) on both ends. The left end of the strip is a surface(32) that is used for standardization. The area between the two diaphragm strips are the reaction field. There is an aperture in the hydrophobic outer surface(38) where the blood sample is applied. Over the reaction field and below the aperture is the hydrophilic inner layer(36) that spreads the sample over layer(36). Figure 4 shows there is a gap between the inner layer(36) and the reaction field(34).

The Office has read the claimed *"inert carrier"* on the taught **web(26)**, the claimed *"application zone"* on the taught **layer(36)**, the claimed *"channel gap"* on the taught **gap between layer(36) and the reaction field** and the *"hydrophobic structure"* on the taught **outer surface(38)**.

4. Claims 1-3 are rejected under 35 U.S.C. 102(b) as being clearly anticipated by CA 2095982 teaches a test strip to determine an analyte of interest in a whole blood sample. Claims 1-2 teach the strip comprises a testing pad with a small pored side defining a testing surface and the opposite side having relatively larger pores defining a sample receiving surface. A porous sample transport medium containing a reagent is attached to the small pored side and is capable of transporting the blood sample. The large pored side is coated with a hydrophobic polymer.

The Office has read the claimed *"inert carrier"* on the taught **small pored side**, the claimed *"application zone"* on the taught **larger pored side**, the claimed *"capillary channel"* on the taught **porous sample transport medium** and the *"hydrophobic structure"* on the taught **hydrophobic polymer coating**.
